Correlated Electron Materials

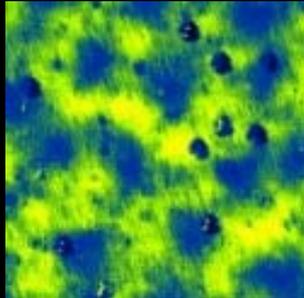

- High- T_c superconductors: $\rho = 0$ up to $T = 135$ Kelvin
- Colossal magnetoresistance: B-field changes electrical conductivity by 1000x
- Multi-ferroics: magneto-electric-elastic coupling
- Heavy fermion materials: $m^* = 1000 m_e$
- Graphene: $m^* = 0$
- Topological insulators: dissipationless spin; fractional charges; magnetic monopoles

Outlook

Magnetic Force Microscope

Pros and Cons of MFM

Tip Geometry

Con: Imperfectly known

Pro: Up to 20 nm spatial resolution

Other signals

Con: See atomic forces too

Pro: Simultaneous topography

Invasiveness

Con: Tip exerts force on vortex

Pro: Tip exerts force on vortex

Force between tip and sample:

$$\mathbf{F} = \nabla(\mathbf{m} \cdot \mathbf{B})$$

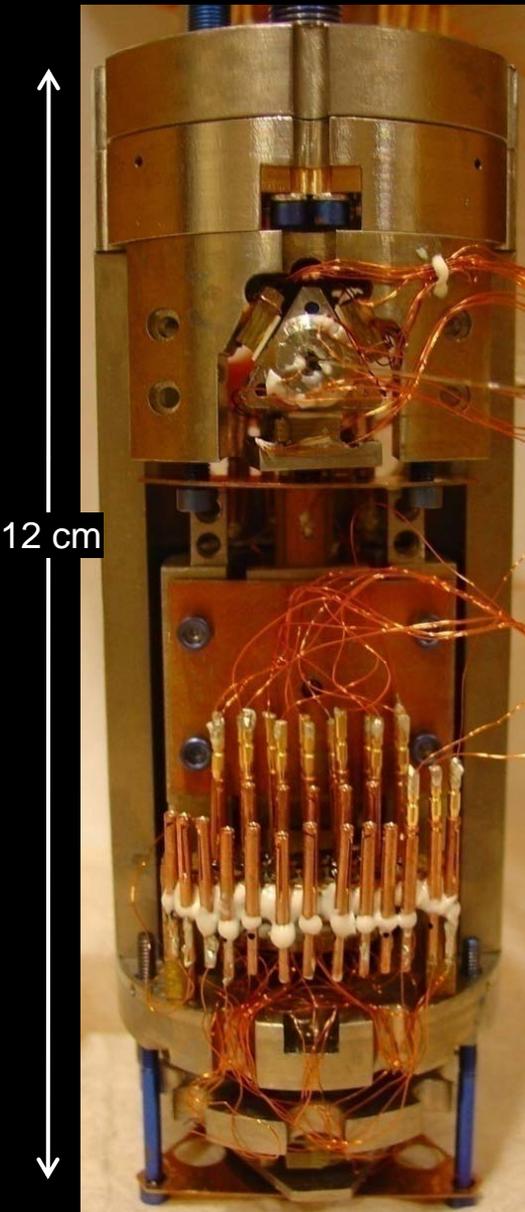

Frequency modulation imaging

(directly measures force gradient):

$$\frac{\Delta\omega}{\omega_0} = \frac{-1}{2k} \frac{dF_{ts}}{dz}$$

Vertical force gradient → imaging
Horizontal force → manipulation

Hoffman Lab Force Microscope

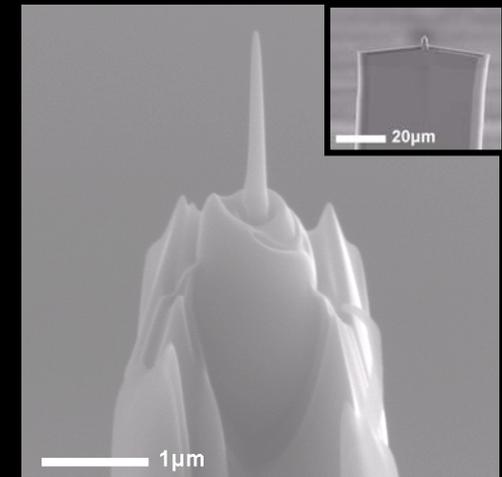

- 2 K to above 340 K
- 5 T vertical field
- lateral coarse motion (3 mm x 3 mm) allows imaging of isolated features in addition to bulk materials
- high-resolution, easily modelable tips fabricated in house via focused ion beam

Radius of curvature : 15-25 nm

Cone half-angles : 1-3°

Aspect ratios : 12-18

Versatility:

- vertical or lateral force measurement
- magnetic tips for magnetic imaging and manipulation
- conducting tips for local conductivity imaging and switching
- vertical cantilevers for friction imaging

built by Dr. Jeehoon Kim

High- T_c Cuprate-Pnictide Conclusions

	Cuprate: $\text{Bi}_2\text{Sr}_2\text{CaCu}_2\text{O}_{8+d}$	Pnictide: $\text{BaCo}_x\text{Fe}_{2-x}\text{As}_2$
phase diagram	<p>Temperature vs Carrier concentration. Regions: AF ins., Pseudo-gap, "non-Fermi" liquid, Superconductor, Fermi liquid?</p>	<p>$T(\text{K})$ vs x. Regions: AF, SC, tetragonal, orthorhombic. Transitions: T_α (structural transition), T_β (magnetic transition), T_c (superconductor).</p>
ground state	antiferromagnetic Mott insulator	itinerant antiferromagnet semimetal
superconducting gap, Δ	$\Delta \sim 33 \text{ meV}$ $2\Delta/k_B T_c \sim 6-10$	$\Delta = 6.25 \text{ meV}$ $2\Delta/k_B T_c = 5.73$
gap inhomogeneity	$\sigma \sim 7 \text{ meV}$ $\sigma/\Delta \sim 21\%$	$\sigma = 0.73 \text{ meV}$ $\sigma/\Delta = 12\%$
gap symmetry	d-wave	s_\pm

High- T_c Cuprate-Pnictide Conclusions

	Cuprate: $\text{Bi}_2\text{Sr}_2\text{CaCu}_2\text{O}_{8+d}$	Pnictide: $\text{BaCo}_x\text{Fe}_{2-x}\text{As}_2$
coherence length, ξ_0	2.2 nm	2.7 nm
Anisotropy	~ 50	1-3
vortex pinning	 <p>vortices pinned to surface impurities</p>	 <p>vortices NOT pinned to surface impurities</p>

- Local probes access nanoscale inhomogeneity \rightarrow “see” correlations
- Image and manipulate magnetic vortices
- Surface probes can access bulk properties

High-Tc Superconductivity

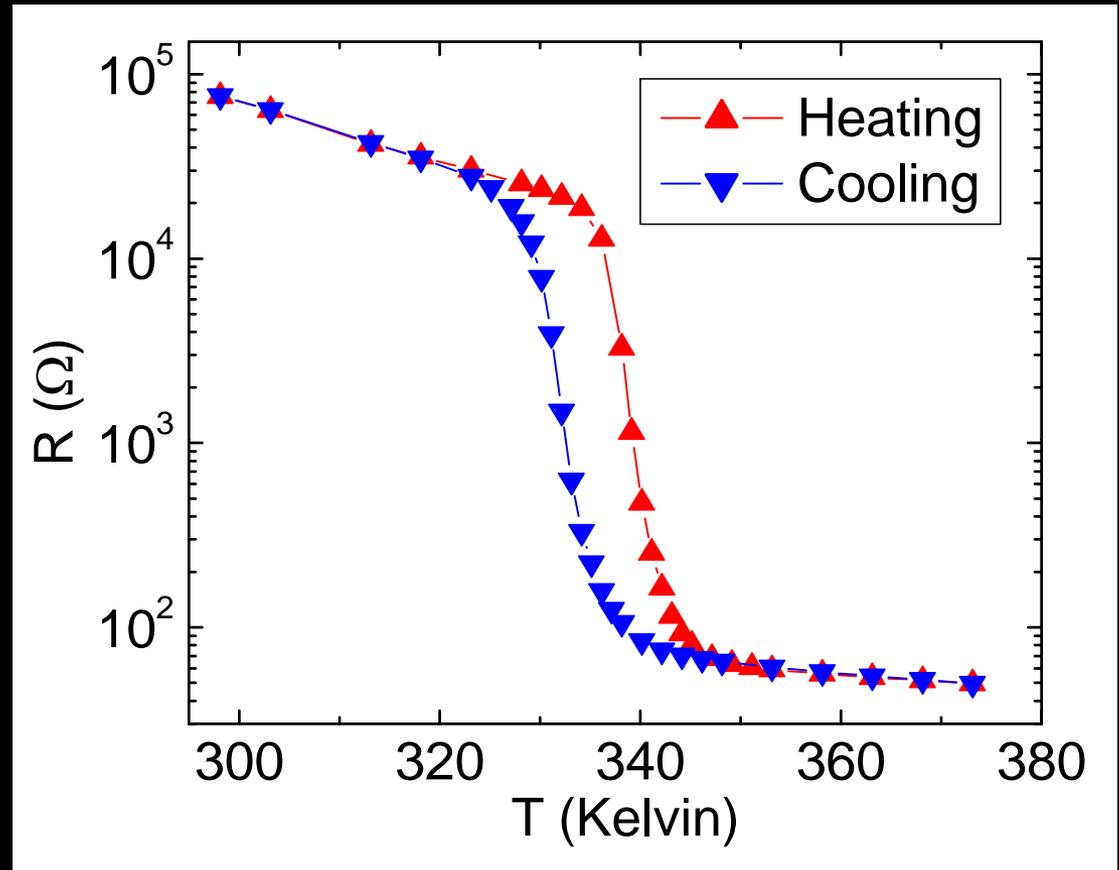

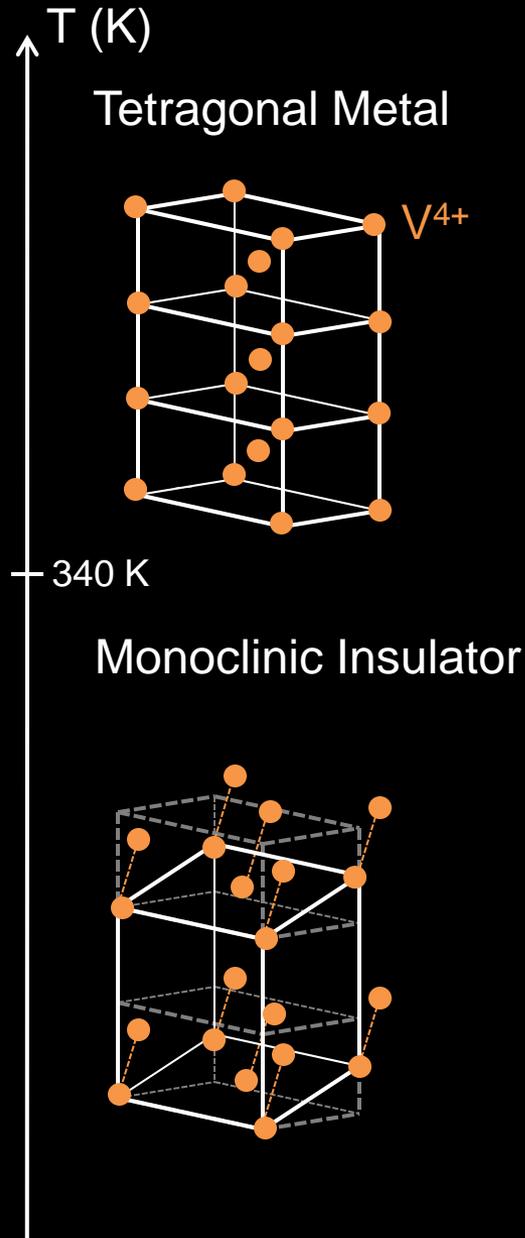

- Can we understand it? → need to understand Mott
- Can we use it? → need to understand vortices
 - scanning tunneling microscope
 - vortex imaging in $\text{Ba}(\text{Co}_x\text{Fe}_{1-x})_2\text{As}_2$
 - force microscope
 - vortex manipulation in $\text{NdO}_{1-x}\text{F}_x\text{FeAs}$

Metal-insulator transition in VO_2

- Can we understand it? → isolate electronic & structural
- Can we use it? → Mott manipulation

Outlook

VO₂ Metal-Insulator Transition

Also transitions as a function of

- stress (~38 kbar)
- optical excitation
- applied voltage or current (~10⁷ V/m ??)

→ up to 5 orders of magnitude change in conductivity

High-Tc Superconductivity

- Can we understand it? → need to understand Mott
- Can we use it? → need to understand vortices
 - scanning tunneling microscope
 - vortex imaging in $\text{Ba}(\text{Co}_x\text{Fe}_{1-x})_2\text{As}_2$
 - force microscope
 - vortex manipulation in $\text{NdO}_{1-x}\text{F}_x\text{FeAs}$

Metal-insulator transition in VO_2

- Can we understand it? → isolate electronic & structural
- Can we use it? → Mott manipulation

Outlook

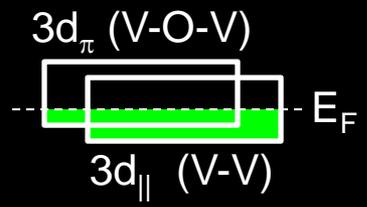

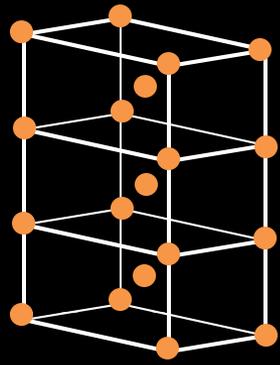

VO₂ Metal-Insulator Transition: Physics

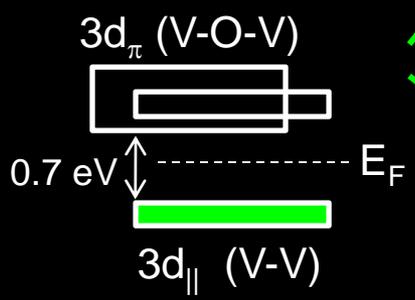

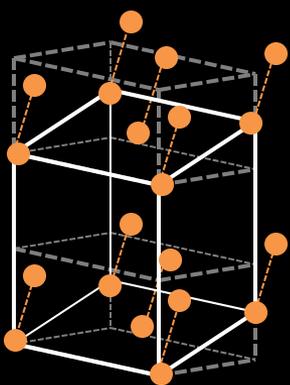

T (K)

340 K

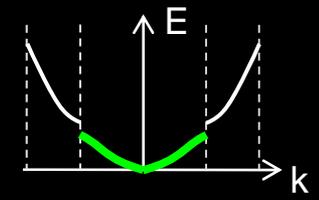

Tetragonal Metal

Monoclinic Insulator

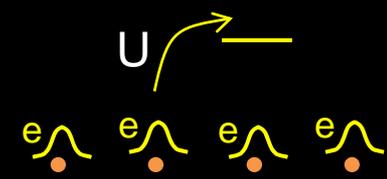

Band insulator?

- Goodenough, Phys. Rev. 117, 1442 (1960)
- Wentzcowitch, PRL 72, 3389 (1994)

Mott insulator?

- Zylbersztein & Mott, PRB 11, 4383 (1975)

VO₂ Questions

Mott vs. Peierls (electronic vs. structural)? (*Mott may be more interesting*)

- m^* increases, approaching metal \rightarrow insulator transition
Qazilbash, Science 318, 1750 (2007)
- $\Delta t = 80$ fs, limited by exactly $\frac{1}{2}$ period of structural phonon
Cavalleri, PRB 70, 161102 (2004)

Can Mott exist w/o Peierls? (*Mott would be even faster, wouldn't crack crystal*)

- 46 years (1959 – 2005): answer is **NO**
- Raman spectroscopy \rightarrow yes?
H.T. Kim, APL 86, 242101 (2005)
- Local IR microscopy (electrical) & x-ray diffraction (structural) \rightarrow yes?
Qazilbash, unpublished APS March talk (2010)

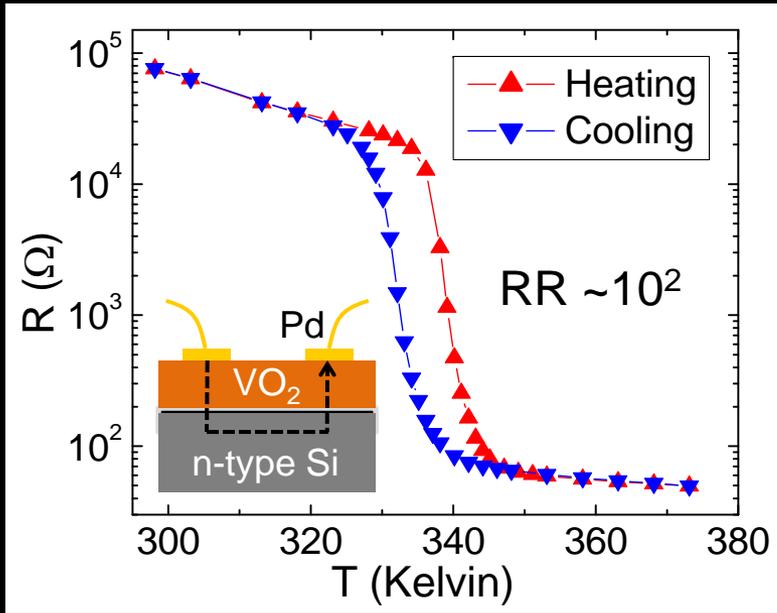

Can it be entirely E-field driven or need heat too ? (*would like zero quiescent current*)

- 3-terminal (field-effect) devices show transition (but questions of breakdown voltage...)
Stefanovich, JPCM 12, 8837 (2000)
Qazilbash, APL 92, 241906 (2008)
- thermal modeling says Joule heating is not enough to drive transition
Gopalakrishnan, J. Mat. Sci. 44, 5345 (2009)

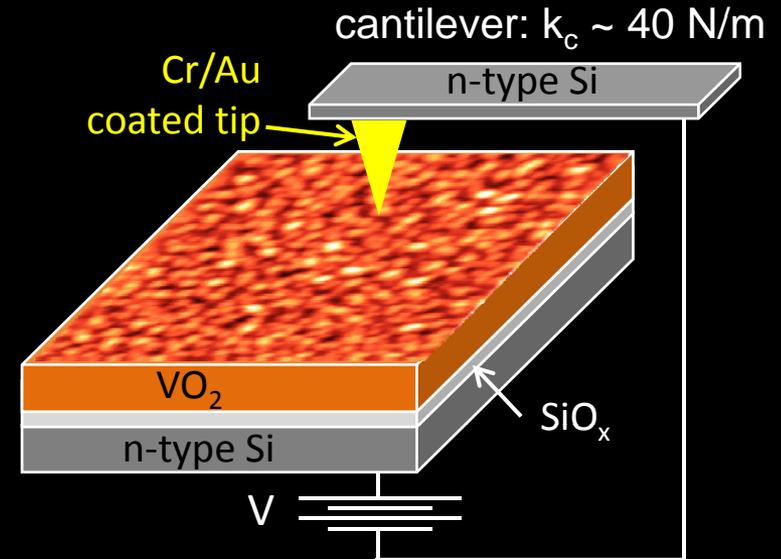

Bulk vs. Local

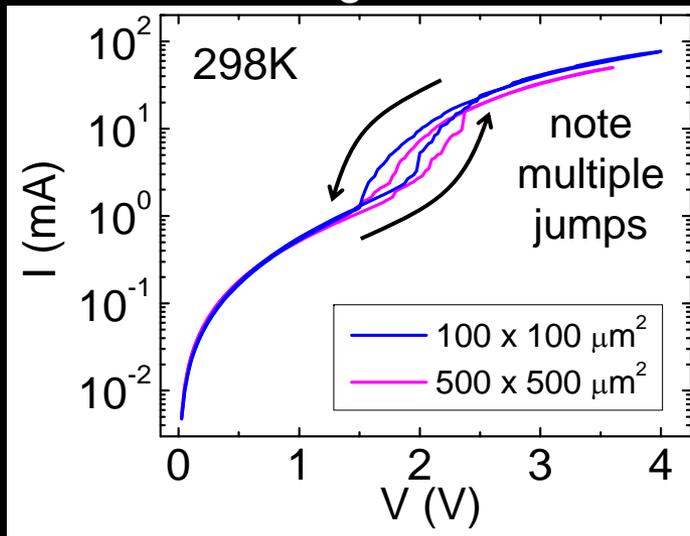

Bulk thermal transition

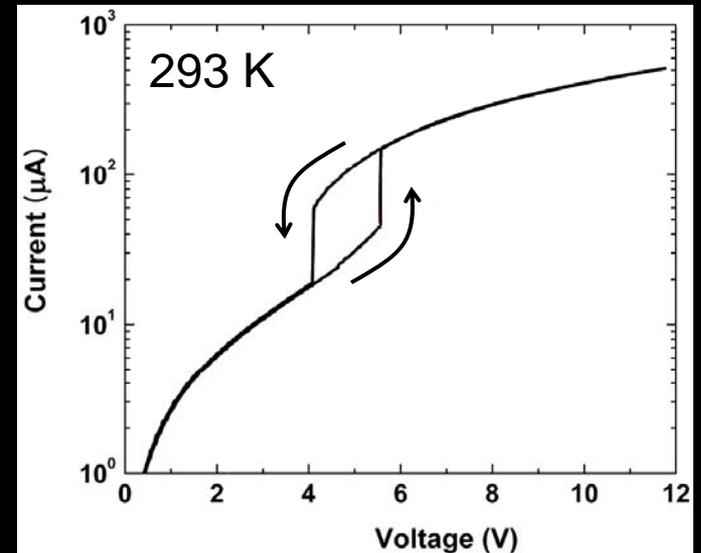

Local geometry:

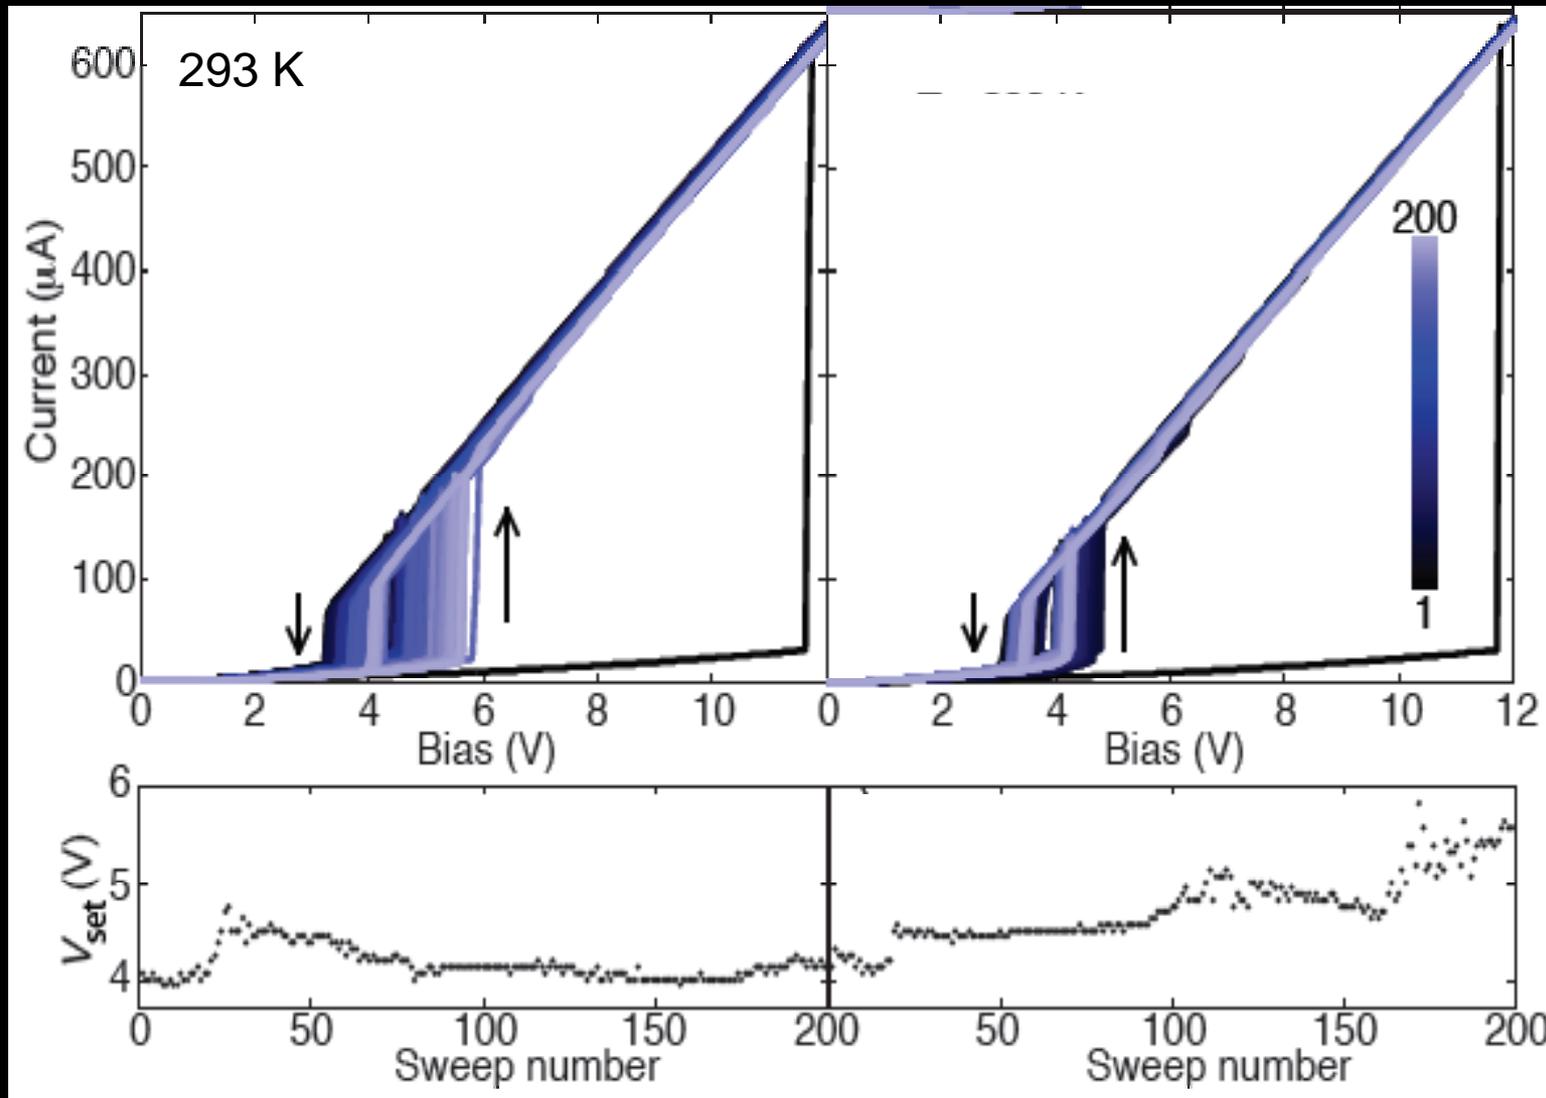

Look for bulk voltage transition

Single Point IV (conducting AFM):

Training & Repeatability

Training voltage: Typically one or several high voltage sweeps necessary before IV hysteresis loops roughly stabilize with $\sim 5\%$ jitter

Stefanovich, JPCM 12, 8837 (2000)
Qazilbash, APL 92, 241906 (2008)
- thermal modeling says Joule heating is not enough to drive transition
Gopalakrishnan, J. Mat. Sci. 44, 5345 (2009)

\rightarrow scanning gate microscopy

High-Tc Superconductivity

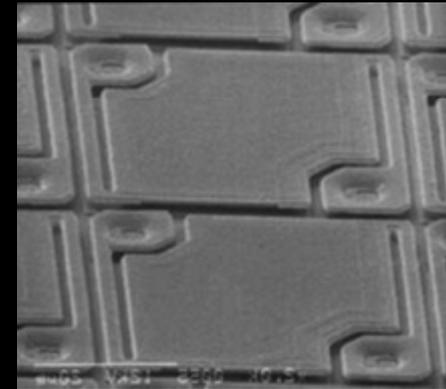

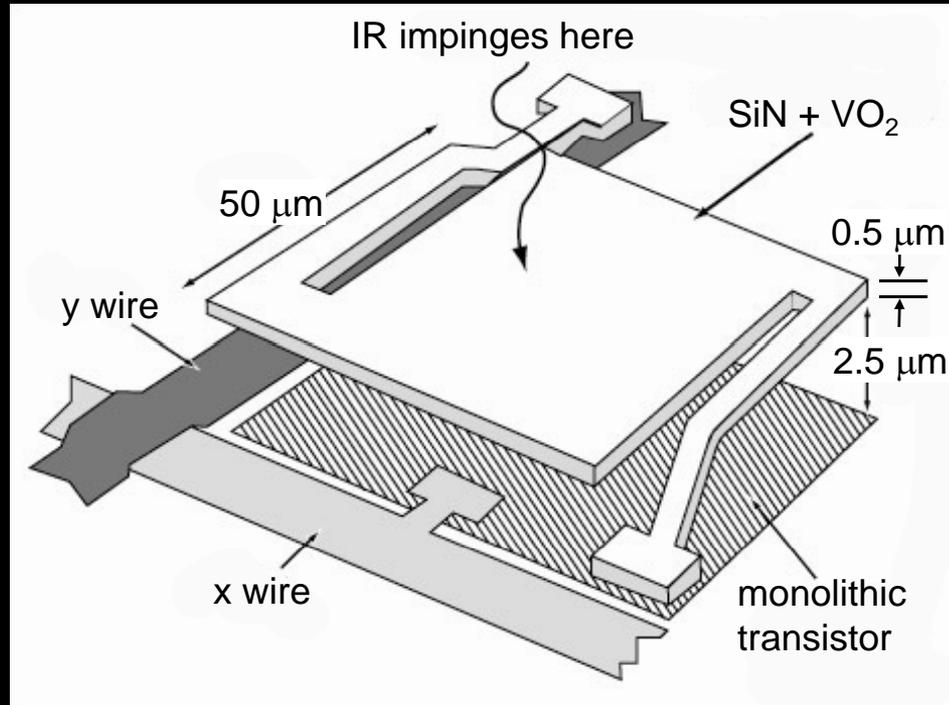

- Can we understand it? → need to understand Mott
- Can we use it? → need to understand vortices
 - scanning tunneling microscope
 - vortex imaging in $\text{Ba}(\text{Co}_x\text{Fe}_{1-x})_2\text{As}_2$
 - force microscope
 - vortex manipulation in $\text{NdO}_{1-x}\text{F}_x\text{FeAs}$

Metal-insulator transition in VO_2

- Can we understand it? → isolate electronic & structural
- Can we use it? → Mott manipulation ?

Outlook

VO₂ micro-bolometers for IR imaging

<http://www.security-int.com>

<http://www.thermodelta.hu>

- pixels size as small as ~ 25 μm
- pixel arrays up to 640 x 480

VO₂ tunable metamaterials

“Invisibility cloak”:

fabricate copper patterns on
standard circuit board
with fixed dielectric

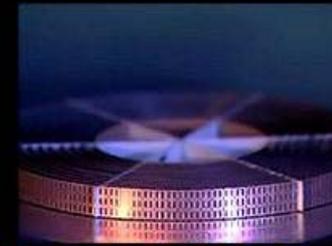

Problem: narrow, fixed bandwidth

Proposal: use VO₂ substrate

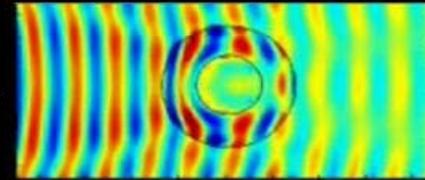

→ tunable dielectric

→ tunable metamaterial bandwidth

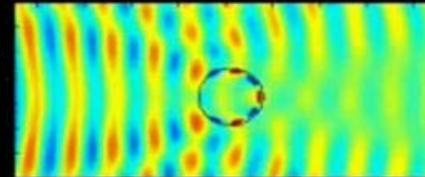

Prototype:

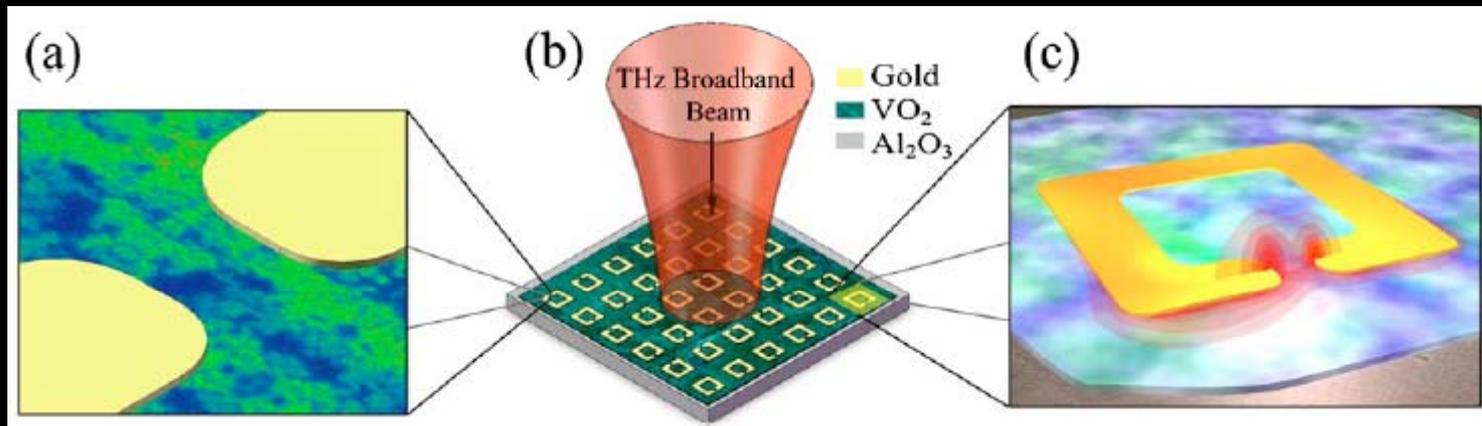

Cloaked
Cylinder

Cylinder
Without
Cloak

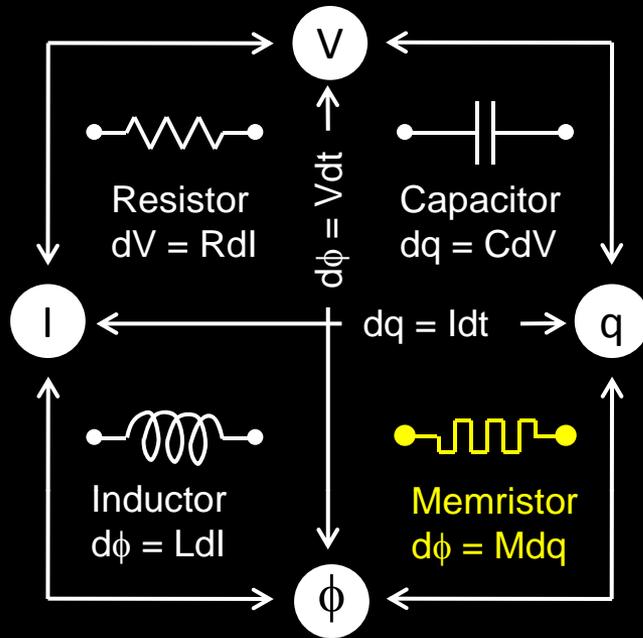

David Smith, Duke University

Driscoll, APL 93, 024101 (2008)

Memristors

Applications

- Memory circuits
- Digital logic circuits
(e.g. FPGA = Field Programmable Gate Array)
- Analog circuits
(e.g. neural learning networks)

L. Chua, *IEEE Trans. Circuit Theory* 18, 507 (1971)

D. Strukov, *Nature* 453, 80 (2008)

Integral form

$$\int d\phi = \int M(q) dq$$

Differential form

$$M(q) = \frac{d\phi}{dq} = \frac{d\phi / dt}{dq / dt} = \frac{V}{I}$$

A memristor remembers its resistance, based on the history of charge flowing through it.

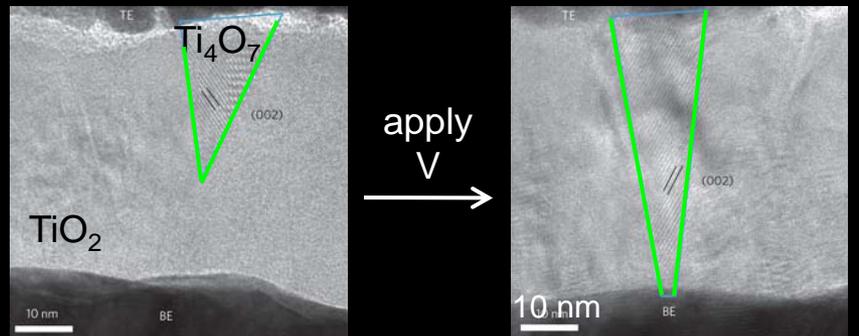

VO₂ Memristors

Mechanism 1:
oxygen migration

Mechanism 2:
conductive channel formation

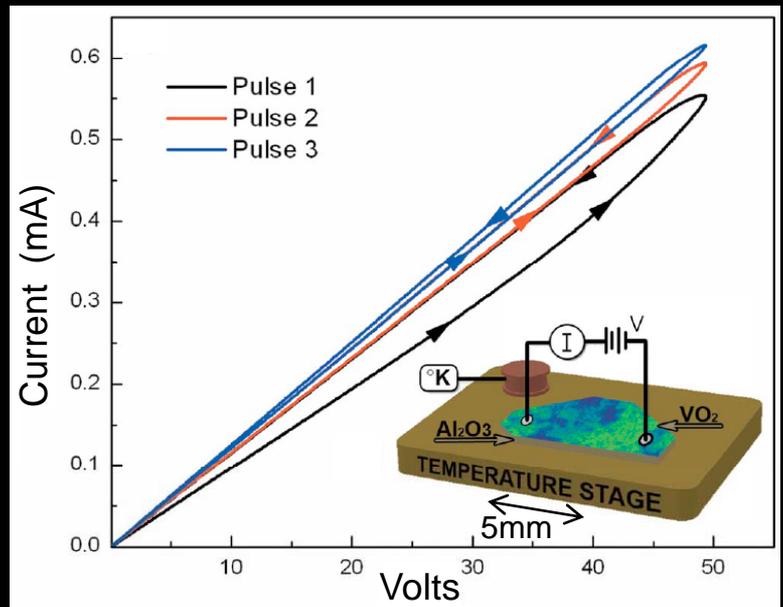

Kwon, Nat Nano 5, 148 (2010)

→ messy, disordered...
problems with reproducibility

Mechanism 3:
phase change

→ potentially cleaner, reproducible

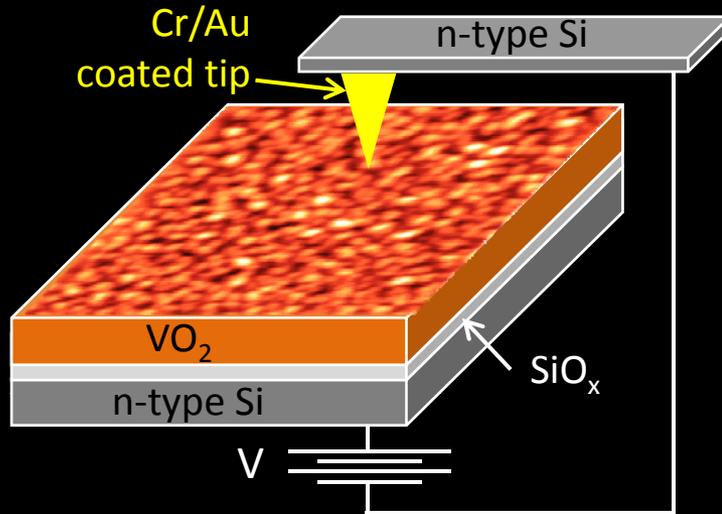

Driscoll, APL 95, 043503 (2009)

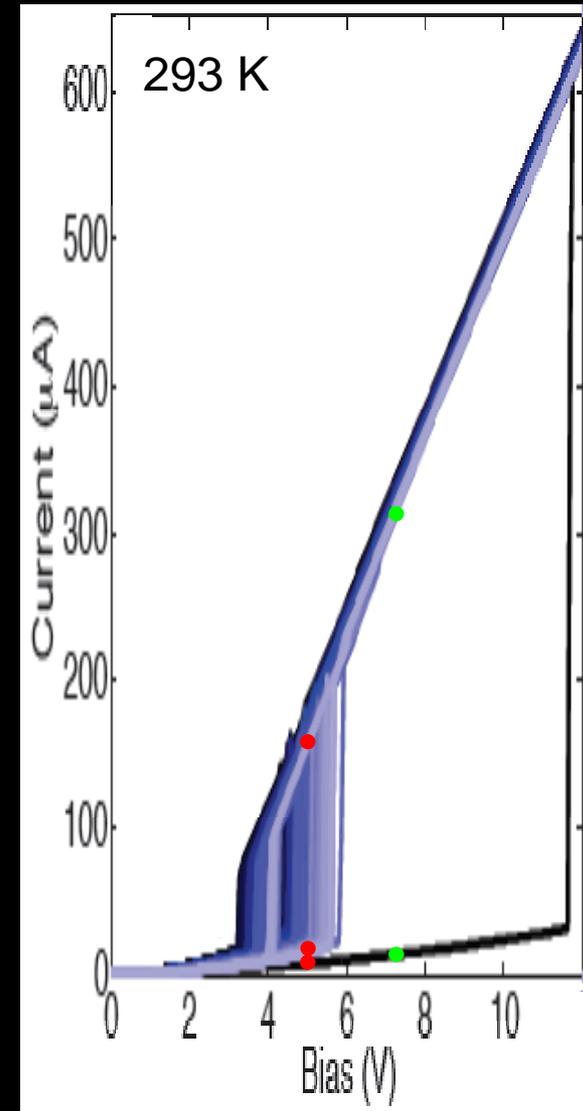

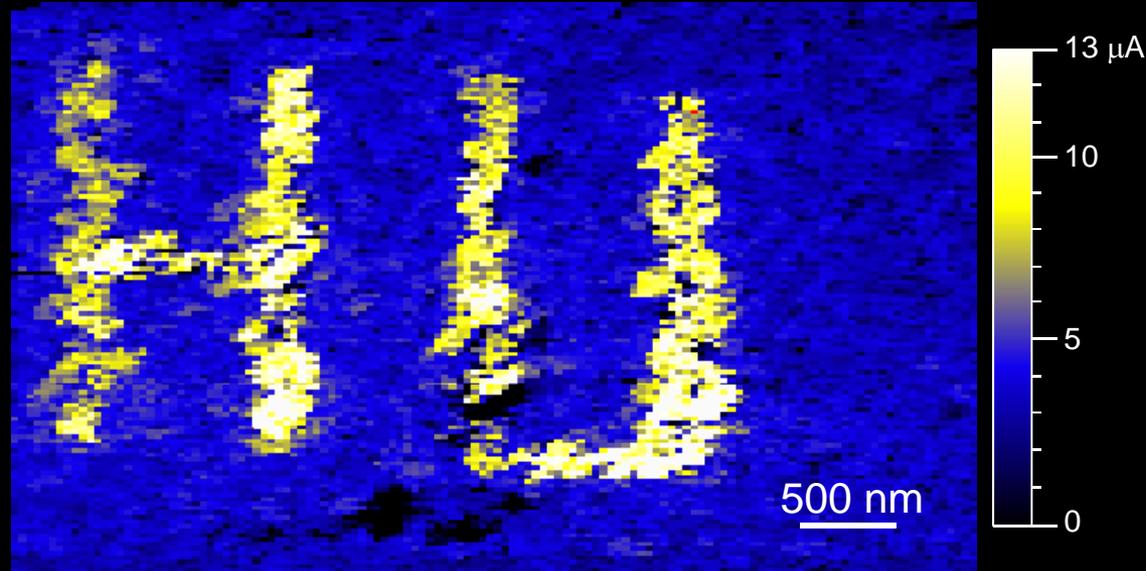

Memristive Writing ?

Step 1: "write" with 13 V tip bias

Step 2: read current (local resistivity) with 3 V tip bias

High-Tc Superconductivity

- Can we understand it? → need to understand Mott
- Can we use it? → need to understand vortices
 - scanning tunneling microscope
 - vortex imaging in $\text{Ba}(\text{Co}_x\text{Fe}_{1-x})_2\text{As}_2$
 - force microscope
 - vortex manipulation in $\text{NdO}_{1-x}\text{F}_x\text{FeAs}$

Metal-insulator transition in VO_2

- Can we understand it? → isolate electronic & structural
- Can we use it? → Mott manipulation

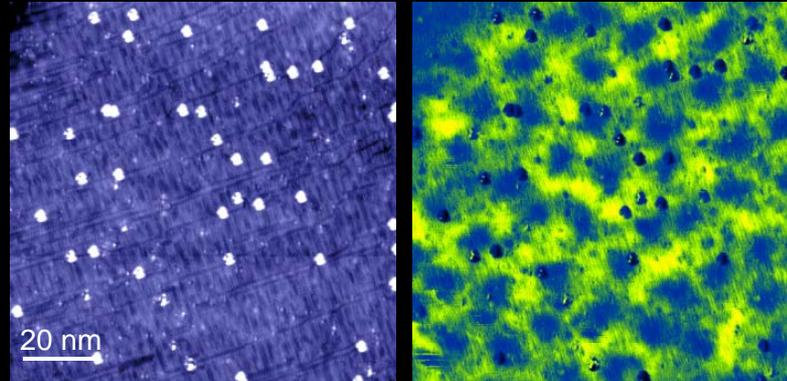

Outlook

Conclusions

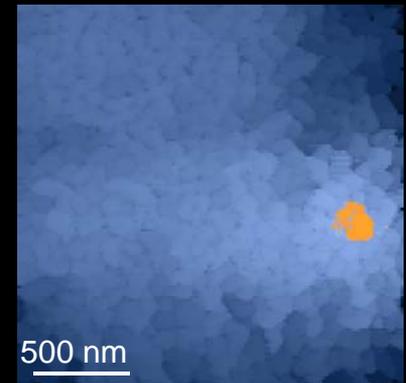

Iron-Pnictide Superconductors

- more homogeneous than cuprates \rightarrow less highly correlated
- stronger vortex pinning

Vanadium Oxide

- controlled local transition (single grain, 10s of nanometers)
- after training, hysteresis is repeatable

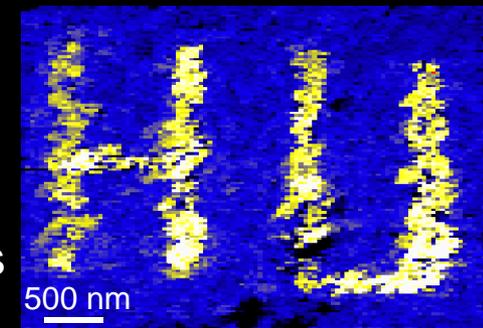

Outlook

- correlated electron systems \rightarrow local inhomogeneity \rightarrow need local probes
- surface probes can access bulk properties, e.g. vortex pinning
- passive imaging \rightarrow active manipulation

To Do Next

- Quantify vortex pinning forces in iron-pnictide superconductors
- “Write” the Mott transition in vanadium oxide & other systems
- Image & manipulate other correlated systems, e.g. topological insulators
